BL046	FINEVISION HP TORIC (POD FT 49P)	The POD FT 49P (FINEVISION HP TORIC) posterior chamber intraocular lens is indicated for the replacement of the human lens to achieve the visual correction of aphakia and pre-existing corneal astigmatism in astigmatic adult patients in whom a cataractous lens has been removed by phacoemulsification who desire improved uncorrected vision, reduction of residual refractive cylinder, useful near and intermediate visual functions, and reduced spectacle dependence. The intraocular lens is intended to maintain rotational stability after placement in the capsular bag and is intended to be placed in the capsular bag. The GF-Glistening Free, material is an acrylic copolymer of medical quality which includes a UV absorbing filter. For the yellow intraocular lenses, a blue light-filtering chromophore is covalently bounded to the UV-absorbing material and the spectral transmittance through a central diopter IOL. BL038	B+L FINEVISION HP (POD F GF)	POD F GF test intraocular lens (IOL) is a foldable IOL with a quadripode “POD” open-loop design intended for capsular bag implantation. acrylic copolymer of medical quality which includes a UV (wavelength < 400 nm) absorbing filter and a blue light-filtering chromophore which is covalently bounded to the hydrophobic material.

The optical part of the test POD F GF lens is biconvex and aspherical partially compensating the positive spherical aberration of the cornea. The optic bears a diffractive TRIFOCAL element on its anterior side (toward patient pupil), allowing for presbyopia correction and spectacle independence for near and intermediate visions. The add-power at the IOL plane for the near vision is + 3.5 diopters and for the intermediate vision + 1.75 diopters.

POD F GF is intended for implantation in the capsular bag after human lens extraction after cataract. The IOL material is capable of being folded prior to insertion, allowing placement through an incision (2.0-2.2 mm) smaller than the optic diameter of the lens. After surgical insertion into the eye, the lens unfolds to ReSTOR the optical performance. The supporting haptics provide for proper positioning and fixation of the IOL optic within the eye.

RQ084	Glaukos iStent inject W System	An improved product to PLAC billing code RQ075 (product name iStent Inject) with a wider flange for better surgeon visualisation and stent confirmation. The improvement includes a delivery injection unit with 2 stents. Intended purpose per TGA submission is for implantation with or without cataract surgery and to reduce intraocular pressure in adult patients diagnosed with mild to moderate primary open-angle glaucoma (POAG) currently treated with ocular hypotensive medication.	One Size	\$1,444.00
RQ075	iStent Inject System	The iStent Inject is a pre-loaded injection system which delivers two stents across the trabecular meshwork to provide a pathway for aqueous humor to flow from the anterior chamber. It is indicated for use in conjunction with cataract surgery for the reduction of IOP in subjects with mild to moderate open angle glaucoma currently treated with ocular hypotensive medication.	One size	\$1,444.00
QQ325	Glaukos iStent Infinite System	<p>The iStent infinite System consists of a single-use pre-loaded injector designed to deliver, with an unlimited insertion mechanism, three intraocular stents (Model G2-W) through a single incision into Schlemm’s canal, creating a bypass through the trabecular meshwork to increase physiological aqueous outflow and reduce IOP. The stents used in the iStent infinite System are identical to those in iStent inject W (Billing code RQ084), which is designed to deliver two stents.</p> <p>As per the TGA submission and associated Instructions for Use, the iStent infinite is intended to reduce IOP in adult patients with primary open-angle glaucoma, pseudo-exfoliative glaucoma or pigmentary glaucoma, and can be performed with or without cataract surgery. It may also be implanted in</p>	One Size	\$1,444.00

arranged centrally (round) towards the implant shaft or eccentrically (oval). In the eccentric version (oval), an additional groove has been worked into the plate to improve receiving the malleus handle.

Variable - The implant body consists of two parts, a shortenable shaft that is firmly bound to the prosthesis bell, and a prosthesis plate that has been provided with a borehole in its underside. The borehole has been dimensionally designed in such a way that it can receive the shaft after the latter has been adapted lengthwise to the respective situation in the middle ear.

The surface of the predefined contact point (upper side of implant plate and inner side of the bell) is roughened in order to facilitate better bonding to the eardrum resp. the stapes head.

TORP - Total Ossicular Replacement Prosthesis

Total implant made of titanium, for reconstructing a destroyed middle-air ossicular chain (chain of sound transmission) between the footplate of the stirrup bone and the plane of the eardrum. The implants are available in fixed length and adjustable versions for shortening. The implant can be subdivided into three areas: 1.) the implant shoe; 2.) the implant shaft; 3.) the perforated implant plate. The implant plate can be arranged centrally (round) towards the implant shaft or eccentrically (oval). In the eccentric version (oval, fixed length only), an additional groove has been worked into the plate to improve receiving the malleus handle. The surface of the predefined contact points (upper side of implant plate and implant shoe) is roughened in order to facilitate better bonding to the eardrum resp. the stapes footplate. To improve the adaptation of the implant plate to the plane of the eardrum, the angle between the implant plate and shaft can be optimally adapted because the shaft below the implant plate tapers off (onwards from a total length of 3.5 mm). The product is available in different lengths. The length information is stated both on the outer package as well as on the product's sterile packaging.

QQ319	Apollo Endosurgery X-Tack™ Endoscopic HeliX Tacking System	The X-Tack™ System is intended for approximation of soft tissue in minimally invasive gastroenterology procedures (e.g. closure and healing of ESD/EMR sites, and closing of fistula, perforation or leaks).using tensioned helical tacks. The X-Tack system comprises respective delivery systems for tacking and cinching; tethered stainless steel HeliX tacks; and a PEEK cinch system. 1. The delivery system is composed of biocompatible plastic and drives the HeliX tacks into the tissue. This is replaced with the PEEK cinching system when the defect is ready for compression. 2. The stainless steel HeliX tacks are placed around the defect with the tether providing compression when tensioned and so enabling closure. Compression is maintained using a PEEK cinch which terminates the closing construct. 3. The PEEK cinching system is a delivery system that deploys a PEEK plug/collar to the tethering system to ensure the tissue in the defect area remains compressed.	160 and 235 cm	\$2,002.00

The self-expanding braided stent is characterised by an excellent opening behaviour, superior wall apposition and a very smooth surface. It is intended for use with embolization materials in the treatment of intracranial aneurysms. Accero's full range of sizes can be delivered through a small 0.0170" microcatheter and can be resheathed up to 95%. HW567	Neuroform ATLAS Stent System	The Neuroform Atlas (Atlas) Stent System is intended to be used for stent assisted embolization for intracranial aneurysm therapy. The purpose of the stent is to retain the occlusive devices within the aneurysm. Occlusive devices can be delivered prior to stent placement or after stent placement. The Atlas Stent System consists of a self-expanding, sterile, nitinol stent preloaded over a delivery wire inside an introducer sheath. The sheath and delivery wire are	Stent Diameter (mm): 3.0, 4.0, 4.5 Stent Length (mm): 15, 21, 24, 30	\$6,769.00

used to transfer the stent into a 0.0165 to 0.017 inch internal diameter microcatheter. After transferring the stent, the sheath is removed from the proximal end of the delivery wire. The delivery wire is then used to advance the stent to the distal end of the microcatheter. The microcatheter and stent system are repositioned as a unit to ensure the stent is located across the aneurysm. The stent is deployed by stabilizing the delivery wire and withdrawing the microcatheter. The Neuroform Atlas stent cannot be repositioned or captured once deployed.

VK 037	C-Nail End Caps	C-Nail is an intramedullary nail for minimally invasive fixation of intraarticular calcaneal fractures. The principle is to stabilise with the nail the four to five main	End Cap: 0mm, 5mm, 10mm, 15mm, 20mm.	\$96.00

fragments of the fractured calcaneus in conjunction with up to seven interlocking screws and thus creating angular stable fixation. The maximum stability is achieved by fixing the sustentacular fragment towards the nail with two interlocking screws guided by a very precise aiming device. The design of the nail is clearly marked "L" for left foot and "R" for right foot. The nail length is 65mm with a diameter of 8mm. The nail can be extended and closed with an end cap that comes in 0mm, 5mm, 10mm, 15mm and 20mm sizes.

gradual correction of paediatric congenital as well as acquired deformities in both the upper and lower extremities, provided that the physics are not fused. The plates feature a contoured waist and low profile for paediatric usage. There is a centre hole in the plates for a temporary guide pin to be implanted to aid application and removal of the plate. The plates are attached to the external surface of the bone over the growth plate by screws. These screws are not locked to the plate, but rather are allowed to swivel and diverge in their position as bone growth occurs. The implant acts

like a flexible hinge, permitting growth at the growth plate to gradually straighten the limb.

methodology and principles of Prof Ilizarov. The circular frame is simple, offering preassembled functional components that are easy to connect and operate. The frame is stable with anti-rotational feature on connection elements that prevents any undesirable movement. Its unique wire and half pin fixation elements provide efficient bone segment stabilisation. A biomechanically superior metal-plastic interface is stable both during and between adjustments. The system is versatile, consisting of rings, half-rings, foot plates, 5/8 rings and

arches. Full control of bone segments accomplished with Orthofix circular frame allows precise movement of segments without compromising stability.

032	Adjust Strut	strut is made of two metal casings encapsulating a threaded rod. It has the ability to correct acutely or gradually. The rapid adjust strut ends have 45 degree locking angulation with 360 degree rotation. The rapid adjust struts have unique ball and claw universal lockable joint at both ends of the				5.00

strut. Two rapid adjust struts are sufficient for fracture reduction and initial stabilisation, whereas three rapid adjust struts are necessary for walking and weight bearing. Loosening of the ball claw joints allows for verification of the amplitude of angular correction and horizontal translation, magnitude of rotational correction and stability of fixation in coronal, sagittal and horizontal planes.

locking bolt and clamp washer. The inner tube is attached to a spring-loaded, black knurled adjustment knob. The adjustment knob mates with the threaded rod in a manner such that the rod translates relative to the inner tube when the knob is rotated. This will provide gradual changes of overall strut length in 0.5mm increments. A reference arrow with plus sign located on the base of the adjustment knob indicates the direction of turning to perform strut elongation - distraction. Each strut has two special joints and one at the base of the outer tube and the other at the

end of the threaded rod. Each joint has a mounting stud, which can be inserted into the mounting holes on the ring tabs and held in place by the locking screw. The rapid adjustment of the strut length is achieved by untightening the side locking bolt, sliding the inner tube relative to the outer tube to the desired length. The rapid adjustment is indicated by the inner tube scale in 1mm increments relative to the orange line mark on the outer tube. The gradual adjustment is achieved by pulling and rotating the adjustment knob resulting in a noticeable

detect click every 0.5mm of adjustment. Gradual adjustment is indicated by the scale relative to the green line mark.

VK	Orthofix	The Orthofix	100mm - 220mm foot plates	\$1,87
031	Circular Frame Foot Plate	circular frame is a surgeon designed, user- friendly ring fixation system for trauma applications, limb lengthening and deformity correction. It is based on the science, methodology and principles of Prof Ilizarov. The circular frame is simple, offering preassembled functional components that are easy to connect and operate. The frame is stable with anti- rotational feature on		2.00

connection elements that prevents any undesirable movement. Its unique wire and half pin fixation elements provide efficient bone segment stabilisation. A biomechanically superior metal-plastic interface is stable both during and between adjustments. The system is versatile, consisting of rings, half-rings, foot plates, 5/8 rings and arches. Full control of bone segments accomplished with Orthofix circular frame allows precise movement of segments without compromising stability.

This Membrane is considered to be a barrier for tissue regeneration. polytetrafluoroethylene membranes or mechanical barriers for guided bone regeneration are used to prevent migration of cells from epithelial and connective tissues, thus providing a proper space for the formation of a natural fibrin structure which is the bone tissue precursor. Surgitime PTFE are a high-density sheet with a surface structure and porosity suitable to prevent intergration and passage of bacteria within the interstices of the material, and simultaneously facilitate adhesion of the host cells and the material.	30x20mm- Thickness 0,10mm 30x20mm- Thickness 0,25mm	\$159.00

implant individually designed from a 3D Computed Tomography (CT) or Cone Beam CT (CBCT) scan provided to MAXONIQ by the referring surgeon. The OsseoFrame is fixated to alveolar bone of the maxilla or mandible to fit the natural contours. An OsseoFrame is comprised of a baseplate with holes for screw fixation and transmucosal connectors for dental prosthesis attachment. The OsseoFrame is intended to be used on the alveolar bone of the mandible or maxilla to provide a stable and permanent platform for fixation of the dental prosthesis. The OsseoFrame is indicated to restore oral function and facial aesthetics in edentulous patients missing 3 or more adjacent teeth with atrophic jaws, low sinus floors or who have undergone partial jaw resection. The OsseoFrame may also be beneficial for patients who cannot tolerate removable dentures and desire a fixed solution; who cannot tolerate complex bone graft surgery to support dental implants; or if they want replacement teeth immediately after surgery. The dental prosthesis is supplied separately and is to be fitted by surgeon, a restorative dentist or a prosthodontist. The OsseoFrame may be supplied with a biomodel and a surgical guide, both these items have separate Prosthesis Listings.

variant of the prosthesis. Effectively, these size variants are designed for partial overdentures (2 and 3 post variants) or a 4 post variant for full arch restoration. The 4 post, full arch variant is designed to treat a fully edentulous patient, whilst the 2 and 3 post variants are designed to treat patients missing 3 or more teeth. The clinician and prosthodontist will determine the appropriate number of posts for an individual patient.

RF013	SonR tip PS55D Lead	The SonR tip™ lead is an atrial endocardial pacemaker lead equipped with a hemodynamic sensor embedded in the tip of a straight, bipolar RA pacing lead · Unlike other automatic optimisation strategies, the signal recorded by the SonR sensor reflects global ventricular contractility · Optimisation by SonR is similar to continuous AV and VV optimisation by echocardiography. It is supplied in a non-MRI and MRI conditional version. The package includes a lead, with a straight stylet inserted, suture sleeve mounted and funnel mounted on the connector pin, a vein lifter and stylets.	Length - 520mm, Diameter 2.6mm, 7.8 F	\$536.00

TU068	Thoraflex™ Hybrid	<p>Thoraflex™ Hybrid device is a woven polyester prosthesis, with the addition of nitinol ring stents.</p> <p>The device is specifically designed for the treatment of aneurysm and/or dissection in the ascending thoracic aorta, aortic arch and descending thoracic aorta. Branches are provided to accommodate reconstruction of the major aortic branch vessels and intra-operative attachment of a perfusion cannula during cardio-pulmonary bypass where antegrade perfusion techniques are employed.</p> <p>The stented section of the graft enables treatment of the diseased descending thoracic aorta in a single-stage procedure without the need to anastomose a stented and unstented prostheses together.</p> <p>Thoraflex Hybrid™ device has been impregnated with an absorbable protein. The aim of the impregnation is to provide a polyester vascular prosthesis which does not require pre-clotting. The protein is a bovine gelatin which has been cross-linked to a set level to control its rate of removal. It serves in place of fibrin, which seals the polyester prosthesis during normal pre-clotting. The gelatin is hydrolyzed within approximately 14 days and is replaced by normal tissue incorporation. Gelatin has been chosen as it is a non-toxic protein, a fact which is reflected by its extensive use as a safe plasma expander.</p>	<p>The stent graft comes in two nominal lengths (100mm or 150mm) with different inner vessel (ID) and outside vessel OD graft diameters (mm).</p> <p>There are 40 catalogue items with the above combinations</p> <p>Overall length: 340-390 mm. LC198	2M Cups Double Mobility System Mobile Liners (UHMWPE)	The liner functions as part of a double mobility system. The liner articulates with an acetabular cup and femoral head as part of a total hip arthroplasty. The liner has an inner clearance of 0.3 mm with respect to the femoral head. The outer clearance has been increased to 0.6 mm to avoid locking of the outer joint due to the interposition of fibrous tissue. The centre of the inner head is cranialized with respect to the centre of the liner (1,5 mm), to permit the self-centring of the system. screws and locking caps. The 3D Fusion lumbar bone screw is intended to be used as part of the integral screw fixation system and immobilize and stabilize the 3D fusion lumbar cage to facilitate spinal fusion between two adjacent vertebral bodies. The 3D fusion lumbar bone screws are self-drilling, self-tapping, dual thread bone screws designed to fit with threaded features of the 3D Fusion lumbar Cage to secure and stabilise the fusion cage in place with patient's endplate anatomy.

GK004 3D fusion cervical screw	<p>The 3D Fusion cervical screw is part of the integral fixation mechanism for the 3D Fusion cervical System (also consisting of the 3D Fusion ACDF Cage and Locking Cap). These components are part of separate applications. The 3D Fusion ACDF Bone Screws intend to immobilize and stabilize the 3D Fusion ACDF Cage and facilitate spinal fusion between two adjacent lumbar vertebral bodies. The 3D Fusion ACDF Bone Screws are self-drilling, dual thread bone screws designed to fit with integral fixation features of the 3D Fusion cervical system. The threaded locking cap system establishes an intrinsic link between the cage and the fixation screws, creating a rigid locked system, without distortion of the screw head</p>	Length = 12mm – 20mm Diameter = 4.0mm & 4.5mm	\$401.00

GK001	3D fusion ACDF	Stand-alone anterior cervical discectomy and fusion (ACDF) fixation system: cage, screws and locking cap. The 3DMorphic ACDF integral screw fixation device (cage) is intended to immobilize, stabilize and maintain the height between instrumented segments and support loading in the cervical spine until fusion occurs. The 3DMorphic ACDF device has a trapezoidal, ring shaped footprint with a central graft window that can receive bone graft. The superior and inferior surfaces of the device are made to fit the patient's vertebral endplate anatomy and feature serrated teeth to resist expulsion from the interbody space. The anterior surface of the device features screw holes and a threaded locking cap hole as the device is designed for use with integral fixation screws and a locking cap. The device is offered in a variety of footprints, heights, lordotic and scoliotic angles according to the patient's anatomy and surgeon's specifications.	Footprints: 10mm to 23mm L x 08mm to 30mm W. Minimum anterior height is 6mm. L = Anterior-posterior depth (DD in the catalogue), W = width (WW in the catalogue), height and angle vary according to surgeon request as the devices are custom-made. ER646	Forza XP Expandable Spacer System	The Forza XP Expandable Spacer System is comprised of an assortment of non-sterile as well as sterile, single use, titanium alloy and polyetheretherketone (PEEK) polymer spacers with height expansion capability. The expandable interbody spacer is inserted into the lumbar disc space and expanded to fit the patient anatomy. The implants are offered in parallel, lordotic, and hyperlordotic configurations to help restore the natural curvature of the	Length: 24 mm - 28 mm Width: 10 mm Starting height: 6.5 mm - 12.5 mm	\$3,313.00

spine. The implants can be used in single placement or pairs with typical approaches being transforaminal lumbar interbody fusion (TLIF) and posterior lumbar interbody fusion (PLIF). The implants feature a bulleted nose for ease of insertion and anti-migration ripples on both the inferior and superior surfaces to provide increased stability and help prevent anterior/posterior movement of the device.
